

**CHAPTER 16: PROBABILITY MODELS**

Bernoulli Trials, if...: Random trials; 2 different types - \_\_\_\_\_

1. There are two possible outcomes (success & failure)
2. The probability of success is constant
3. The trials are independent

Geometric Probability Model	Binomial Probability Model
Appropriate for a random variable that counts the number of Bernoulli Trials until the 1 <sup>st</sup> success	Appropriate for a random variable that counts the number of successes in a fixed number of Bernoulli trials
<p>p = probability of success q = 1 – p (failures)</p> <p><math>P(X = x) = q^{x-1}p</math></p> <p>Expected value: <math>\mu = \frac{1}{p}</math></p> <p>Standard Deviation: <math>\sigma = \sqrt{\frac{q}{p^2}}</math></p>	<p>p = probability of success q = 1 – p (failures) n = number of trials</p> <p><math>\binom{n}{k} p^k q^{n-k}</math> or <math>{}_nC_k p^k q^{n-k}</math></p> <p>Expected value: <math>\mu = np</math></p> <p>Standard Deviation: <math>\sigma = \sqrt{npq}</math></p>
